

CARPET GRASS

Carpet grass is a creeping, stoloniferous, perennial, warm season grass

Appearance:

It has wide leaves with blunt, rounded tips and forms a dense mat which crowds out most other species. It is not recommended for a high quality lawn.

Uses:

Carpet grass is best suited to Sub Tropical/Tropical regions of Australia, and will thrive in low fertility areas, making it ideal for parks, roadsides, and Golf Course roughs.

Wear & Tolerance:

Carpet Grass has poor wear and cold weather tolerance with only fair shade tolerance.

Establishment:

Carpet Grass requires a loose, smooth and firm seedbed.

It can be established from seed or sprigs, but seeding is often easier and less expensive.

For a quick cover, broadcast 1kg of carpet grass per 100m². Rake the lawn lightly.

Establishment can be hastened by light applications of a complete fertilizer at monthly intervals.

Carpet grass will not survive on very sandy soils, as it has a shallow root system.
