

SOX FAN

TURF TYPE

PERENNIAL RYEGRASS

Sox Fan is a new release from Rutgers University combining high turf quality with improved pythium resistance. With improved traffic tolerance, Sox Fan is at home on the heavy use sports field, as well as on the golf course and lawn uses that demand turf quality as well as disease and traffic performance. Its colour and texture blend well with other cool-season grasses, and will tolerate a low height of cut. Additionally, Sox Fan has performed exceptionally in Bermudagrass overseeding trials, resulting in very high ratings for uniform full-season turf quality from establishment through transition.

Features:

- Wear tolerance
- Excellent turf quality
- Contains endophyte
- Dark green colour

Applications

Use Sox Fan Perennial Ryegrass in blends with other high performance perennial ryegrasses and mixtures with other cool season species on golf course fairways, tees and roughs, sports turf, and lawn and landscape applications.

Geographical Adaptation

Adapted to the cool season zone and transition zone, as well as arid regions with irrigation and the warm season zones for winter overseeding bermudagrass turf.

Seeding Rates:

- New Establishment: 4–5kg per 100m²
- Overseeding Dormant Warm Season Grasses: 3–4kg per 100m²
