

BRONTE PERENNIAL RYEGRASS

Bronte is a fine leaf, dense perennial ryegrass, that has strong cool season growth. It has high wear resistance.

Features:

Bronte is an endophyte-enhanced variety that will provide protection against Black Beetle, Argentine Stem Weevil, as well as other turf insects.

Bronte has early spring growth and excellent winter growth. It is an ideal variety to include in a seed mixture that requires winter recovery.

Bronte can be blended with other perennial ryegrasses that will provide all year performance.

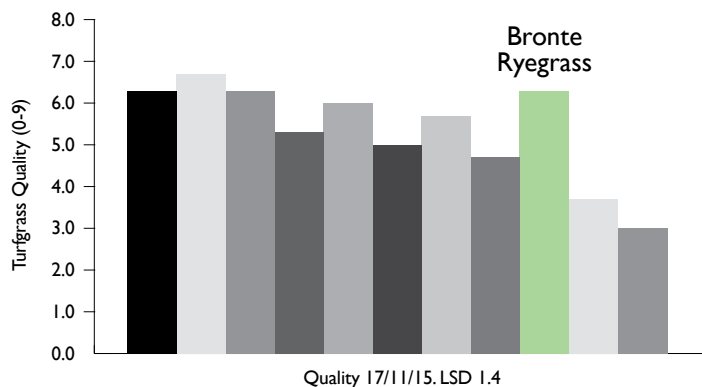

Seeding Rates:

Seedling germination can be expected in 5 to 7 days after sowing. For best results, a seeding rate of 250-400kg/hectare is recommended. For overseeding a rate of 100-300kg/hectare is recommended depending on wear.

Mowing:

Recommended mowing height for Bronte is 13 to 50mm. Generally application of a balanced Fertiliser containing nitrogen will maintain vigour, density and turf quality. If winter wear is a priority apply nitrogen in autumn and winter, rather than spring.
